

Flattest Wall Surface

The Dominator Forming System produces the flattest wall surface of any hand set aluminum form with minimal form joints due to the unique side rail design.

The overall form thickness is 25% thicker than a standard hand set aluminum form.

The contact edge of the forms is a continuous solid extrusion with no leak points as each taper tie hole is closed when inserting the taper tie. This leads to a minimal form joint signature left on the concrete surface.

Concrete build up is an issue that can be eliminated due to the external bracing being offset and shielded from the form joint by 1.125". This design does not require additional form connector points therefore no empty pin holes that allow leaking.

Create walls so smooth that all you have to do is paint!

Precise Forms Ledger System

Pitched roofs or flat decks/roofs are easily cast when the Dominator wall system is used in conjunction with the Precise Forms Ledger System.

The Precise Forms Ledger System enables the contractor to form and pour the walls, beams, columns, and deck in one continuous pour. The Precise Forms "Decking Support System" allows for stripping of the primary deck forms without removing the support columns while the curing process takes place.

The Precise Forms Ledger System has been utilized in high production and custom work on a global scale. The system has experienced success in the single family one story market, as well as multi family multi story high density construction.

Dominator Forming System

Patent Pending

The Dominator Forming System provides an alternative to typical flat tie forming systems. It produces flat, straight walls with little or no visible form seams making it ideal for commercial and international applications. No special equipment or gaskets are required which can wear out over time.

Create Flatter, Better Looking Walls

With reasonable maintenance the life of this form will out perform its nearest competitor. The Dominator incorporates a unique factor, that being a form which receives very few hits with a hammer. This is due to the fact that the form locking device is separate from the form itself and is located at the back of the side rail. The Dominator is the only aluminum forming system to make this claim and perform with increased strength. The load point of the tie system has been moved as far from the load as possible, 2 1/2" on the Dominator as compared to 13/16" on a standard form. This lends itself to less vertical deflection, metal fatigue and flatter, better looking walls.

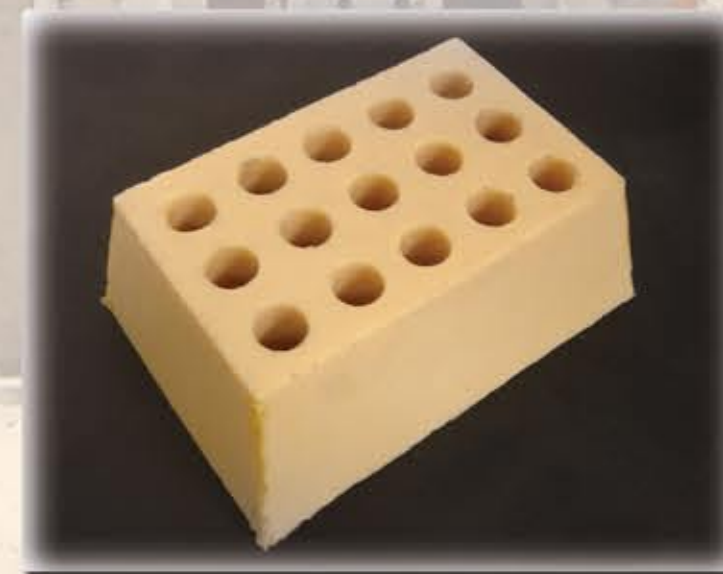

The Dominator Forming System can easily be ganged without additional ganging hardware. This allows for rapid construction saving the contractor time and money. The Eliminator can be incorporated on the ends of the gang. No need to go outside the structure.

The taper tie advantage provides minimal form joint signatures on the wall compared to the standard flat tie system. This creates a flatter wall surface which reduces preparation time when finishing the wall.

The waler and form locking device provide sufficient support to allow the forms to be ganged without additional hardware.

Plug Molds allows the contractor to pour plugs for the taper tie system on site. This allows excess concrete to be used rather than wasted as well as creating the best color match when plugging the taper tie holes.

Eliminator Forming System

Patented

The Eliminator Forming System has a unique trait that is not available with any other forming system. This form can be set from one side of the wall and requires a mere 2 3/4" clearance from one structure to the next. The stripping of the Eliminator takes place from above eliminating the need to be outside the wall to work. When constructing large numbers of units on a small plat of land, the Eliminator allows the contractor to easily maximize land use.

Another element that increases the life of the Eliminator is that when good concrete placement procedures are used, the form rarely requires any hammer strikes. With the Eliminator working in conjunction with the Dominator system, there is no need for loose hardware thereby reducing the labor and accessory costs. This is a 36" or 90cm modulated forming system and provides even more cost reduction when compared to a 24" or 60cm modulated forming system.

The eliminator Forming system will resolve all the risk of pouring single sided formed walls. With positive internal support of the form with the use of the taper tie, the need for massive external bracing is Eliminated.

Window and door openings are cast in place simultaneously with the walls and ceilings.

The system can be hand set or ganged without additional accessories allowing rapid and high quality castings!
